Infrastructure

The future belongs to the fast

Today's business landscape is constantly changing. Your customers expect higher standards of service with shorter delivery times at lower costs. Rapid changes in technology and higher expectations are driving the need for new applications and better service delivery. To succeed, you have to move rapidly. That puts IT in a critical position.

Be agile... or be left behind

Your business needs to be agile to adapt. This requires new models of application development, service delivery and infrastructures that allow you to respond to customer requirements at unprecedented speed. But adopting these new models significantly increases IT complexity. Applications now span multiple infrastructures, are consumed 'as-a-service', and utilise new deployment methodologies, such as microservices or containers.

What we do

Integration across all infrastructure disciplines and simplification through machine learning and automation are essential. At IGXGlobal, we specialise in designing, building and securing automated multi-cloud infrastructures, helping you move from a traditional infrastructure to an agile, integrated multi-cloud environment that will enable you to better serve your customers.

20+ years on Nasdaq / 40+ locations serving the U.S., Europe and Asia-Pacific / 1,500+ employees / 650+ engineering team / $1.9B FY19 gross billings
